Summary

I help companies facing an acute bottleneck find where AI pays off: I build a proof of concept in a fixed time budget, typically two months, and often take it to production and generate value for the client within that budget. My proudest work so far: a customer-support automation, built as sole AI engineer, that processed 811 live tickets in its first three months, with 86.6% of in-scope drafts approved by reviewers.

Software Development Experience

AI Engineer - Software Consultant *Munich, Germany*
TNG Technology Consulting *Dec 2025 – present*
AI systems for clients and TNG: support automation, manufacturing scrap analytics, an internal agent platform.

- Architected the support automation in Python and took it to production in April 2026: deterministic paths for the >80% of tickets with a known intent, an agentic fallback for the long tail, and nothing reached a customer without staff approval. Daily volume rose ~5x after an internal CEO showcase.
- Built a loop in which a nightly coding-agent run turned reviewer rejections, plus my implementation plan, into eval-gated pull requests, so every reviewer rejection became a regression test.
- Orchestrated multi-step resolutions on Temporal with durable retries and deterministic replay, pausing mid-workflow for staff sign-off before any resolution ran; migrated the persistence layer under live load, bringing reviewer requests back under 2 minutes.
- Sole engineer on a scrap-prediction proof of concept: benchmarked ~40 model combinations and showed with five methods that scrap is predictable mainly from order attributes fixed at booking.
- Co-built an internal sandboxed agent platform (Tauri/React, Rust) that cleared a 15-person red-team, unlocking approval for a department-wide rollout; co-developed an LLM offer-review service on Kubernetes.

Platform Engineer - Software Consultant *Munich, Germany*
TNG Technology Consulting *Dec 2024 – Dec 2025*
Platform engineer on a multi-team program modernizing a supply-chain application from Java 8 to 17.

- Delivered in three days a JFrog Artifactory proxy that had been scoped as a multi-month migration, cutting a recurring CI step from eight hours to 30 seconds — saving each developer ~1–2 hours a week.
- Built the CVE dashboards lead developers used to show management the modernization's progress, wiring OWASP dependency scans from the Jenkins pipeline through Prometheus into Grafana.

Data Science Experience

Research Data Analyst - Environmental Epidemiology *Palo Alto, USA*
Stanford University School of Medicine *July 2023 – Dec 2023*
Statistical analysis and data tooling for a national study of air pollution and mortality inequality.

- Led the statistical analysis as co-first author of a *Nature Medicine* paper (2024), which found that over half the Black–White age-adjusted mortality gap in the US is attributable to fine-particulate air pollution; wrote the initial manuscript and led the revise-and-resubmit.
- Built a reproducible pipeline integrating 63M+ death records with pollution estimates and demographic data; open-sourced the analysis code and interactive R Shiny explorer.

Research Data Analyst - Statistical Genomics (Master's Thesis) *Heidelberg, Germany*
European Molecular Biology Laboratory (EMBL) *Oct 2021 – May 2022*
Research on multiple-testing methods for large-scale genomics.

- Implemented IHW-Forest (R, C++ via Rcpp), a multi-covariate extension of hypothesis weighting: on ~16 billion genomic tests it made more discoveries than quantile binning wherever both ran.

Education

University of Heidelberg *Heidelberg, Germany*
M.Sc. in Mathematics *Oct 2020 – May 2023*

- Grade: 1.0. Yale exchange year (Honors grades); exchange semester at the Hebrew University of Jerusalem during the B.Sc.

Skills

Stack: Python, Rust, Java, TypeScript/React, C++

Systems and delivery: Kubernetes, Jenkins, Grafana/Prometheus, Temporal, Langfuse
